

AfriRadar Data API

African fund data, paid for one question at a time.

BEST USE OF X402 ON SOLANA · ENCODE SOLANA HACKATHON 2026

THE PROBLEM

Fund data in Africa is locked in weekly Excel files and quarterly PDFs.

Savers, finance apps and AI agents need one answer at a time. Subscriptions, API keys and card checkouts do not fit a question worth a fraction of a cent.

WHAT WE BUILT

Pay per request in USDC on Solana. No account, no API key.

Data API	Every fund in SEC Nigeria's weekly report and every unit trust scheme in CMA Kenya's quarterly bulletin, sold per request over x402.
AI analyst	Answers plain English questions and buys only the data it needs, inside a spending cap the buyer locks on chain.
For builders and agents	An npm package with an SDK, a command line and an MCP server, so any agent can pay with its own wallet and budget.

ONE REQUEST, END TO END

Price, sign, settle on Solana, deliver.

01

Price

The API answers `402 Payment Required` with the price, the USDC mint and the payee.

02

Sign

The buyer's wallet signs a USDC transfer, or for a question, a capped deposit into a payment channel.

03

Settle

Our own facilitator verifies the payment and settles it on Solana before any data leaves.

04

Deliver

The data comes back with the Solana transaction in the `PAYMENT-RESPONSE` header.

HOW SOLANA POWERS IT

Every payment settles on Solana in USDC: real on mainnet, test on devnet.

Fixed prices	x402 `exact`: one signed USDC transfer per request, settled before the data is released.
The analyst	x402 `upto`: the buyer deposits a ceiling into the Solana Foundation payment-channel program. We settle the itemized bill and the rest is refunded in the same transaction.
No SOL needed	The facilitator runs inside the API and pays the network fee.
Public ledger	Anyone can recount every payment from the chain, in the browser at api.afriradar.com or with `npx afriradar verify`.

PROOF: SOLANA ENFORCES THE CAP

A dishonest server cannot take more than the buyer allowed.

With our own keys we signed a claim for a 0.01 USDC ceiling plus one micro-USDC and sent it straight to the payment-channel program. The same transaction at three amounts:

micro-USDC
3,000
accepted

micro-USDC, exactly the ceiling
10,000
accepted

micro-USDC, one over
10,001
rejected on chain, error 235

FAILED PAYMENTS

A request that fails is never charged.

Errors	If the data or the analyst fails, the payment is cancelled before settlement. The buyer pays nothing.
Late confirmations	If Solana confirms late, the server reads the chain before refusing, and `/v1/redeem` releases the data once the payment shows up.
Wallets that edit transactions	Wallets such as Solflare add safety instructions while signing. The facilitator accepts those and refuses any other change.

DATA FROM THE REGULATORS

Read, checked and published by afriradar.com.

Nigeria, weekly	217 funds holding ₦9.88trn in SEC Nigeria's weekly valuation report (week ended 9 October 2026), every week since January 2025.
Kenya, quarterly	43 unit trust schemes holding KES 851.7bn in CMA Kenya's statistical bulletin (quarter ended 31 March 2026), every quarter since December 2023.
Checked	Every report must add up to the regulator's own totals before it is published, and every figure links to the regulator's file.

LIVE TODAY

Live on Solana mainnet, open to anyone.

LIVE API

api.afriradar.com

Pay real USDC on mainnet from Phantom, Solflare, Backpack or MetaMask, or try it free on devnet with our demo wallet.

ON CHAIN

63 payments

The first 2 in real USDC on mainnet and 61 on devnet, as of 22 October 2026, every one recountable from the chain.

ON NPM

afriradar

SDK, command line and an MCP server with 8 tools. 84 automated tests run on every push.

WHO PAYS, AND WHAT IS NEXT

Cents of value, paid in fractions of a cent.

Buyers	Savings and fintech apps that show fund yields, AI assistants that answer money questions, analysts and journalists.
Pricing	$0.001 to $0.005 per data request. A question to the analyst is capped at $0.05 and usually costs under one cent.
Next	More African regulators once their files can be checked against their own totals, more data products, and the first apps paying on mainnet.

TEAM

Built by Rising Technology and Digital Trend, Kano, Nigeria.

Oluwasogo Ajala	Founder and engineer. Builds and runs afriradar.com, the regulator-data site this API sells from.
Built in the hackathon	This API, its facilitator, the AI analyst, the npm package and the Kenya data, from 13 October 2026.
Existed before	afriradar.com and its Nigeria data files, which this API reads.
